

# Agentic AI Career Counseling Companion

## Domain

Education

## Problem Statement

Students often struggle to choose the right career because career-related information is scattered across multiple platforms. They often lack guidance on selecting suitable career paths, identifying required skills, choosing certifications, improving resumes, and understanding current industry trends.

Existing career counseling systems provide generic recommendations without considering a student's education, skills, interests, projects, and career goals.

This project develops an **Agentic AI Career Counseling Companion** using **IBM watsonx Orchestrate** and **IBM Granite**. The system analyzes student profiles, performs AI-powered resume analysis, identifies skill gaps, recommends career paths, suggests certifications, generates personalized learning roadmaps, and retrieves information from a Career Knowledge Base. By integrating AI reasoning, knowledge retrieval, and REST APIs, the solution delivers accurate, personalized, and context-aware career guidance.
